

Install Abinit

Installing abinit is completely standardized, following linux package conventions as

```
make install
```

Running make install will put the binary executables in a bin/ subdirectory, the documentation and test files in doc/ and so on.

The installation will happen in a reference install directory, which by default is /usr/local/. If you wish to choose your own installation directory, re-run

```
configure --prefix=<your chosen install point>
```

then

```
make
```

and then

```
make install
```

This allows access to the code for many users on a cluster, or the installation of several versions of abinit if necessary.
