

# Beautification 2015: Towards a structured documentation

From HTML → YAML

01/10/2014 : Correction !

Yannick Gillet

# What is already done ...

# What is already done (2) ...

...

abinit\_vars\_new.yml

Beautified version of  
structured documentation

AUTOMATIC

---

Then, I started cleaning stuff ...

abinit\_vars.yml

MANUAL

# What should you do ?

- 1) Correcting current abinit\_vars.yml (today !)
- 2) Cleaning abinit\_vars (afterwards)

# GUI

You can modify  
abinit\_vars.yml  
by hand !

And/or

Use the GUI...

- `java -jar Abivars.jar (`  
`java -jar Abivars.jar n`

Live DEMO !

The screenshot shows a window titled "Input variables" with a menu bar containing "File" and "Edit". On the left is a scrollable list of variable names, with "iatsph" selected. The main area displays the configuration for "iatsph":

Name	iatsph	Edit
Section	vargs	Edit
Default	[1.. <a href="#">natsph</a> ]	Edit
	Comment: null	See error Del error
Dimensions	null	Edit
	Comment: null	See error Del error
Type	integer	Edit
Mnemo	Index for the ATomic SPHeres of the atom-projected density-of-states	Edit
Category		Edit
Description	This input variable is active only in the <a href="#">prtDOS=3</a> case or if <a href="#">pawfatbnd=1</a> or 2. It gives the number of the <a href="#">natsph</a> atoms around which the sphere for atom-projected density-of-states will be built, in the <a href="#">prtDOS=3</a> case. The radius of these spheres is given by <a href="#">ratsph</a> . If <a href="#">pawfatbnd=1</a> or 2, it gives the number of the <a href="#">natsph</a> atoms around which atom-projected band structure will be built.	Edit

# YML specifications

- !variable
  - defaultval
  - text: description of the variable (in HTML)
  - dimensions
  - ...
  - varname: 'myvariable'

# YML specifications : general things

- All the links to a variable should become '[[varname]]'
- !TODO for cleaning part : check and transform all  
<a href="varname">varname</a> to '[[varname]]'

# Values : dimensions

- If value is a scalar => dimensions: 'scalar'
- Else, should be a list of value.

Example: for `rprimd(3,3)`, should become

- 3
- 3

Example: for `xred(natom,3)`, should become

- '[[natom]]'
- 3

- dimensions: null is reserved for errors in principle (ask me if you need something else !)

# Values : dimensions

- Only use simple formulas for expressions
- max, abs, ... + - \* /
- Because we want to be able to parse it !
- If you needed something 'non-standard', please tell me !
- Example: dmatpawu
  - $2 * \max([[lpawu]]) + 1$
  - $2 * \max([[lpawu]]) + 1$
  - $\max([[nspol]], [[nspinor]])$
  - $'[[natpawu]]'$

# Values: defaultval

- Defaultval: null means there is No default !
- There might be default value depending on other variables
  - => Use !valuewithconditions (see after)
- There might be range of values
  - => Use !range (see afterwards)
- There might be list of values => use YAML list syntax:
  - val1
  - val2
- Otherwise should be expressions

# Values: defaultval

- You can use !valuewithconditions
- Is a dictionary:

!valuewithconditions

defaultval: 'value by default'

cond1: 'val1'

cond2: 'val2'

# Values: defaultval

- Example, diemixmag:
- HTML code was : Default is diemixmag= diemix when iprcel=0 or  $70 < \text{iprcel} < 80$  or  $\text{iscf} < 10$  (SCF mixing on potential), else diemixmag= - diemix
- Should be replaced by:

!valuewithconditions

defaultval: -[[diemix]]

' $70 < \text{[[iprcel]]}$  and  $\text{[[iprcel]]} < 80$ ': '[[diemix]]'

' $\text{[[iscf]]} < 10$ ': '[[diemix]]'

' $\text{[[iprcel]]} == 0$ ': '[[diemix]]'

„SELECT CASE“ spirit:

Takes the first condition that is true  
Else take defaultval

Default

```
if 70 < iprcel and iprcel < 80 : diemixmag = diemix  
else if iscf < 10 : diemixmag = diemix  
else if iprcel == 0 : diemixmag = diemix
```

Comment: null

Ed

See e

Del e

# Values: defaultval

- You can also use !range:

!range

start: 1

stop: N

- Example iatsph
- Html code was 1, 2, ... `<a href="natsph">natsph</a>`
- Should be replaced by:

!range

start: 1

stop: '[[natsph]]'

# How to tackle problems

- In general, use comments to describe the default value or the dimensions of the variable.
- Try not to use comments unless it is really needed for the human being to understand
- Conflicts or Requirements are not tackled yet by this YAML file
  - Explicit them in comment :
    - requires: [[varname]]
    - requires: CONDITION
    - excludes: [[varname]]
    - excludes: CONDITION
- If the value is related to the way Abinit is compiled
  - MPI\_IO, ETSF\_IO, ... might be CONDITION in „requires, excludes, everywhere“
  - MPI\_IO, ETSF\_IO, ... are compilation flags

# Check the HTML !

- Afterwards, you can try 'abi\_struct2html'
- `python abi_struct2html [-f file_name.yml]`
- It generates html files in 'html\_output/'
  - ABINIT\_allvariables.html : link to all variables
  - ABINIT\_varXXX.html : variables by category
- The links have been replaced by html links, everything should work
- 
- NB: you need pyyaml
